

PERFORMANCE TESTING

Date	30 sep 2026
Team ID	SWTID-2026-7796
Project Name	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer
Maximum Marks	5 Marks

Performance Testing

Performance testing evaluates how the Standard Laptop procurement workflow behaves under expected and peak load conditions. The workflow includes Service Catalog request submission, approval, Flow Designer execution, Catalog Task creation, and assignment to the Hardware group.

Step 1: Testing Overview

Field	Details
Testing Tool Used	ServiceNow Flow Designer / ServiceNow platform
Type of Testing	Load Testing
Target Module / API	Standard Laptop Service Catalog request, Flow Designer automation, Catalog Task creation
Test Environment	ServiceNow Instance
Test Date	15 March 2026

Step 2: Test Scenarios

S.No	Test Scenario / Description	No. of Virtual Users	Duration (sec)	Expected Outcome
1	Submit a Standard Laptop request through Service Catalog	5	60	Request should be created successfully
2	Process and approve the Standard Laptop request	5	60	Approval should be processed without errors
3	Trigger Flow Designer after approval	5	60	Flow should execute successfully
4	Create Catalog Task and assign it to Hardware group	5	60	Catalog Task should be created with correct short description and assignment group

Step 3: Performance Test Results

The reference project document does not provide actual performance measurements. Therefore, actual values should be entered from the performance testing tool output.

S.No	Metric	Target Value	Actual Value	Status (Pass / Fail)
1	Response Time (Avg)	< 2 seconds	To be measured	Pending
2	Response Time (Max)	< 5 seconds	To be measured	Pending
3	Throughput	To be measured	To be measured	Pending

	(Req/sec)			
4	Error Rate	< 1%	To be measured	Pending
5	CPU Utilization	< 80%	To be measured	Pending
6	Memory Utilization	< 80%	To be measured	Pending

Remarks

Performance values are pending actual testing evidence. The target values are retained from the Performance Testing template.

Step 4: Observations & Analysis

The performance testing should verify whether the Standard Laptop procurement workflow can process multiple requests efficiently. Particular attention should be given to request submission, approval processing, Flow Designer execution, Catalog Task creation, and assignment to the Hardware group. The automated workflow is intended to reduce manual intervention, minimize user waiting time, and improve resource utilization within IT procurement.

Step 5: Screenshots / Evidence

1. Standard Laptop Service Catalog request
2. Request approval
3. Flow Designer execution
4. Created Catalog Task
5. Short description and Hardware assignment group
6. Performance testing results / metrics

Conclusion

The performance testing approach is designed around the automated Standard Laptop procurement workflow implemented using ServiceNow Flow Designer. Testing covers the request, approval, automation, and Catalog Task stages. Actual performance metrics should be added from the testing tool results before final submission.
