Project Name	StreamliningITProcurement:AutomatingStandardLaptopOrderswithFlowDesigner		

SolutionRequirements

Define Functional and Non-Functional Requirements: Create a comprehensive list of requirements to define exactly what your solution will do and how well it will perform.

- **Functional Requirements (FR)** define specific behaviors, functions, or features of the system (What the system should do).
- **Non-Functional Requirements (NFR)** specify the criteria that judge operation and quality rather than specific behaviors (How the system should be).

Step1:FunctionalRequirements(FR)

S.No	RequirementCategory	RequirementDescription	Priority
1	Authentication	Authenticate users, procurement staff, and approvers via enterprise ServiceNow credentials/SSO prior to Service Catalog submission or Flow Designer configuration.	High
2	AuthorizationLevels	Enforce role access: Requestors create orders; Designated Approvers (e.g., Eric Schroeder) approve requests; Hardware Group fulfillers receive and execute Catalog Tasks.	High
3	ExternalInterfaces	Direct integration between ServiceNow Service Catalog, Workflow Studio / Flow Designer execution engine, and sys_approvals tables in the Global application scope.	Medium
4	Transactions Processing	Automatically process requests: generate Requested Item (RITM) from Request (REQ), trigger approval routing, and generate Catalog Task (sc_task) records upon approval.	High
5	Reporting&Visibility	Display live Order Status, stage tracking, delivery estimates, approval history, and activity logs for requestors and IT management.	Medium
6	BusinessRules&Workflow	Trigger flow on "Service Catalog" submission. Once approved, create Catalog Task mapped to Assignment group "Hardware" with Short Description: "Laptop needed to be Configured".	High

TeamMembers: Vajitha T, Sneha N, Kanisiya G	Application: ServiceNow Global Scope

Step1:FunctionalRequirements(FR)—(Continued)

S.No	RequirementCategory	RequirementDescription	Priority
7	Compliance to Regulations	Log all status transitions, timestamps, user identities, and task resolutions into unalterable system worknotes for ITIL compliance and internal audit trails.	Medium
8	Other/Configuration	Link the flow "Standard laptop task" under Maintain Items > Standard Laptop > Process Engine, replacing default execution plans cleanly.	High

Step2:Non-Functional Requirements(NFR)

S.No	NFRCategory	RequirementDescription	TargetMetric/Acceptance Criteria
1	Performance&Speed	Automated instantiation of the hardware configuration task and notification dispatch following approval action.	Catalog Task(sc_task) created and dispatched within < 3 seconds of manager approval.
2	Scalability	Ability of Flow Designer engine and database listeners to support bulk and enterprise-wide laptop requisition events.	Maintains normal response times under concurrent loads of up to 500 simultaneous catalog orders.
3	Security&Data Privacy	Protect employee hardware specifications and internal assignment routing details against unauthorized access.	ServiceNow ACL role enforcement; TLS 1.3 encryption in transit; granular field-level read/write rules.
4	Reliability&Availability	Service Catalog portal availability and workflow background worker execution uptime.	99.9% uptime during operational business hours; zero lost task events during server recovery.
5	Usability&Accessibility	Clean, self-explanatory item request form displaying specifications, price, delivery estimates, and checkout controls.	Meets WCAG 2.1 AA accessibility standards and conforms to standard ServiceNow Service Portal heuristics.
6	Maintainability&Portability	Workflow structure must use low-code Flow Designer blocks under the Global scope without brittle hard-coded scripts.	100% low-code configuration; zero custom JavaScript lines required for core task mapping and routing.
